2019 Survey of the New Zealand Chiropractic Profession: Analysis of Survey Data

Prepared for the New Zealand College of Chiropractic Stakeholders Advisory Committee

Introduction

The Stakeholders Advisory Committee (SAC) advises the New Zealand College of Chiropractic (the College) on trends and developments in the wider community that may help the College to assess and develop its programme. As part of its advisory role, it conducts a triennial survey of the chiropractic profession in New Zealand. This current survey was undertaken during May 2019. The survey was conducted online only and emailed to all registered chiropractors in New Zealand and all College graduates who had an email address listed in the College’s database. E-mails were sent by the New Zealand Chiropractic Board and the College inviting chiropractors to participate. The emails included instructions for completing the survey, the purpose of the survey, and they reassured respondents that the survey was anonymous.

The survey was an update of the survey of the profession conducted by the forerunner “Industry Advisory Committee” in 2001 and the previous SAC surveys conducted in 2004, 2007, 2010, 2013, and 2016.

Response

All registered chiropractors in New Zealand and all College graduates who had an email address listed in the College’s database were invited to participate in the 2019 SAC Survey. Invitations to complete the survey were also made through the College’s Facebook page. There were 640 chiropractors holding current annual practising certificates (APC’s) in New Zealand at the time of the survey.

Three hundred and ten chiropractors completed the survey. Of those 251 were current NZ APC holders, the remainder of the respondents were non-practicing or based overseas. This represents a response rate of 39% of APC holders and overall 51 responses more than the 2016 SAC Survey. The response rate for the 2019 survey exceeds the response rate of similar surveys of the chiropractic profession that have been conducted overseas. Most of the survey analysis included in this report is based on the responses from the 251 New Zealand APC holders, as these responses more accurately reflect the chiropractic profession in New Zealand. Where a
question is less relevant to the practice of chiropractic in New Zealand, all respondents’ answers have been analysed. Questions that include all responses have been indicated throughout the report.

*310 responses were received but 59 were from non-practicing or overseas-based chiropractors who did not hold a current New Zealand Annual Practising Certificate. In 2016, 259 responses were received with 43 from overseas-based chiropractors.

### Representativeness

The response rate is often used as an indicator of the quality or representativeness of survey data. The response rate of the current survey is adequate for a survey of this nature. However, the response rate is not necessarily a good indicator of non-response bias, which may be influenced by several factors. There is likely to be a non-response bias due to the nature of the way chiropractors were invited to participate in the survey. It is likely that College graduates are over-represented. The survey may have a response bias in favour of graduates of the College because the College administered the survey process. Bearing this in mind, we aimed to maximise the response rate by using multiple sources of invitations and acknowledge this potential limitation when analysing and reporting the results of the survey. To understand whether the composition of the responses differs from the composition of the sample as a whole, we have compared the percentage of College graduates who responded to the percentage of APC holders in New Zealand who graduated from the College. We also compared the year of graduation of respondents to that of New Zealand APC holders.

Sixty-nine percent of respondents who hold an APC were graduates of the College (66% in 2016), but only 62% (55% in 2016) of APC holders are College graduates. Therefore, the over-representation of College graduates among respondents is unlikely to be a fatal flaw in the representativeness of the survey.

The percentage of respondents from the College, as well as the tendency of newer graduates to be willing to participate in surveys of this nature, may lead to an over-representation of newer graduates amongst respondents. To investigate this, a chart was plotted based on year of graduation for APC holders and survey respondents practising in New Zealand.
From this chart, it is clear that the decade of graduation is similar between APC holders and survey respondents. In the 2016 survey, there was an over-representation of newer graduates which was not seen in the current survey.

The Chiropractic Practitioner

The first section of the 2019 SAC survey focused on ‘the chiropractor’. Questions in this section asked about their chiropractic education, the length of time they had spent in practice, their qualifications, their position in practice and the nature of their continuing education.

The Chiropractor

Fifty percent of respondents were male, which is a decrease compared to the 54% in 2016 and 65% of male respondents in the 2013 SAC survey. One percent of respondents (n=2) indicated that their gender was diverse. Ninety-two percent of respondents indicated that they were currently practising chiropractic as opposed to teaching or conducting research. Of those not currently seeing patients (more than ten patients per week) 35% (n=6) still work within the chiropractic industry (teaching/research/administration) and only one respondent was not seeing patients because they were unable to find work. The majority of other respondents who were not seeing more than ten patients per week were on maternity leave (n=5), or they were just setting up a new practice or beginning a new job (n=3).

Chiropractic Education

Respondents were asked to indicate which institution conferred their chiropractic degree and the year they graduated. Sixty-nine percent of respondents graduated from the NZCC. This continues the trend of increased representation from NZCC graduates, which makes sense based on the increasing percentage of New Zealand APC holders that graduated from the NZCC (62% in 2019 compared to 55% in 2016).
Length of Time in Practice

Respondents were asked in what year they graduated from chiropractic college. In previous versions of the survey, they were asked when they first registered as a chiropractor in New Zealand.
### Market Readiness

Respondents were asked if they felt that their education adequately prepared them for their chiropractic career? (e.g. Were you 'market ready' when you graduated?). The percentage of NZCC graduates that indicated they were ‘market ready’ when they graduated rose from 63% in 2016 to 70% in 2019. Across the board, 71% of respondents in 2019 indicated they were ‘market ready’ when they graduated compared to 66% of respondents in the 2016 survey. This may be because a greater percentage of respondents in 2016 were newer graduates so were reflecting on more recent challenges or experiences compared to the respondents in 2019. Of the respondents who felt they weren’t ‘market ready’, the most consistent theme in their comments was that they felt that they weren’t well enough prepared for the ‘business’ side of running a practice when they graduated.

### Leadership

Respondents were asked if they participate in a 'leadership' position within or outside of the chiropractic profession? (e.g. NZ Chiropractic Board, NZCA, education, mentorship, spokesperson, health sector, community involvement). Slightly more respondents indicated that they participate in a leadership position in the 2019 survey (38%) compared to the 2016 survey (34%). This may reflect the reduced percentage of new graduates amongst the 2019 respondents. The 22% of respondents who indicated that they don’t participate in a leadership position, but were interested in doing so, were asked what barriers were stopping them. The most common themes were a lack of time (particularly due to family commitments) and that they were new to practic, so felt they lacked experience.

Finding Work

Respondents were asked to indicate how long it took to be offered an opportunity to work in the chiropractic industry from the time they completed their studies. Two-thirds of respondents were offered an opportunity to work in the chiropractic industry before they graduated. When just looking at graduates from the last two years, in the 2019 survey, 84% had an opportunity to work before they finished their studies compared to 74% in the 2016 survey.

<table>

</table>

Regional Representation

Respondents were asked to indicate in what area of New Zealand their main practice was located. The location of respondents is relatively consistent with the 2016 SAC survey.
Main Practice Location (For NZ based respondents) | 2013 SAC Survey | 2016 SAC Survey | 2019 SAC Survey
--- | --- | --- | ---
Northland Region | 7% | 3% | 2%
Auckland Region | 37% | 47% | 43%
Waikato Region | 9% | 9% | 6%
Bay of Plenty Region | 10% | 9% | 9%
Gisborne | - | - | 0.5%
Hawke’s Bay Region | 5% | 6% | 5%
Taranaki Region | 1% | 3% | 1%
Manawatu-Wanganui Region | 4% | 1% | 2%
Wellington Region | 9% | 8% | 10%
Tasman | - | 0.5% | 1%
Nelson Region | 4% | 4% | 4%
Marlborough | - | - | 0.5%
West Coast Region | 1% | 0% | 0.5%
Canterbury Region | 9% | 9% | 11%
Otago Region | 2% | 3% | 4%
Southland | - | - | 0.5%

Tertiary / Post-Graduate Qualifications

Respondents were asked to indicate the highest level of education they had attained. The question options were changed in 2019 to combine a bachelors degree and Doctor of Chiropractic degree. In previous surveys, several respondents who have a Doctor of Chiropractic degree indicated they had a doctoral degree / PhD. This is likely the reason for the small differences in responses in the 2019 survey.

<table>
<thead>
<tr>

</tbody>
</table>

*Question modified in 2019

Respondents were asked to describe their post-graduate diplomate status (or equivalent) through an ACA or ICA speciality board, council, academy, or association. Fewer respondents indicated that they’re working towards a diplomate in 2019. This may reflect the lack of diplomate courses that are currently being run in the region.

</tr>
</tbody>
</table>

### Continuing Education Activities

Respondents were asked to indicate ‘in which continuing education opportunities do you participate?’ In the 2019 survey, the trend continued with another large increase in the percentage of respondents completing online courses or webinars compared to previous surveys. For the first time in the 2019 survey an option of ‘Attend regional NZCA meetings’ was added. Forty-five percent of APC holders indicated they attend these meetings.

Respondents were asked to describe any other CPD activities they engaged in. The most common activities specified included meeting with peers outside of NZCA regional meetings and engaging in formal continuing education.

### Areas of Interest in Continuing Education

Respondents were asked to indicate which areas of continuing education they were interested in participating. The most popular area of interest was chiropractic technique (67%).

*Added in 2019

Barriers to Undertaking CPD

In 2019 a question was added to explore what barriers chiropractors in New Zealand face to undertaking CPD. Cost is the biggest barrier identified by respondents, followed by location.

<table>
<thead>
<tr>
<th>What barriers are there to you undertaking relevant CPD?</th>
<th>2019 +ve Response</th>

</tr>
<tr>
<td>I find it difficult to find enough time to engage in relevant CPD</td>
<td>6%</td>
</tr>
</tbody>
</table>

Position in Practice

New Zealand APC holders were asked to indicate what best described their position in practice. In the 2019 survey, the percentage of sole chiropractors rebounded towards levels seen prior to
the 2016 survey. This may be due to the large number of recent graduates completing the 2016 survey compared to the 2019 survey.

Chiropractic Identity and Practice

In the 2019 SAC survey, respondents were asked three questions about chiropractic identity and practice that they had not been asked before. These questions were drawn from a recent survey of Australasian chiropractic\(^1\) students and North American chiropractic students.\(^2\) In these previous student surveys, the majority of students would like to see an emphasis on the correction of vertebral subluxation, while recognising the importance of evidence-based practice. The authors of these surveys considered these views to be contradictory, suggesting cognitive dissonance (the mental conflict that occurs when beliefs or assumptions are contradicted by new information). In the 2019 SAC survey, 73% of New Zealand chiropractors either agreed or strongly agreed that the primary purpose of the chiropractic examination is to detect vertebral subluxations. This compares to 55% of Australasian students and 47% of North American students. Eighty-eight percent of respondents in the 2019 SAC survey agree or strongly agree that the chiropractic profession is strongly placed to provide care to infants and young children, compared to 68% of Australasian students (this question was not included in the North American survey). In the 2019 SAC survey, 45% of New Zealand chiropractors indicated that they agree or strongly agree that contemporary and evolving scientific evidence is more important than traditional chiropractic principles. This compares to 55% of respondents in each of the student surveys.

## The Chiropractic Practice

This section of the survey investigated the nature of the work environment and chiropractic practice including: office location, practice growth, office procedures and structure, practice management systems, staff requirements, fees, income, practice volume, and billing and office equipment. Survey results for this section were limited to respondents who practise in New Zealand.

### Practice Location

Respondents were asked if they practise in more than one location. Results were consistent with previous surveys.
Practice Location | 2004 % Yes | 2007 % Yes | 2010 % Yes | 2013 % Yes | 2016 % Yes | 2019 % Yes
--- | --- | --- | --- | --- | --- | ---
Do you practise from more than one location? | 29% | 22% | 21% | 24% | 29% | 24%

With regards to office location, respondents were also asked to indicate the type of community their primary practice was located. Results were consistent with previous surveys.

Need for More Chiropractors

Respondents were asked if more chiropractors were needed in their local area. Forty-four percent responded, ‘yes’. If Auckland-based chiropractors are removed this increases to 52%. Only 33% of Auckland-based chiropractors believe Auckland needs more chiropractors. In contrast, 62% of Wellington-based chiropractors believe their region needs more chiropractors.

Practice Growth

Respondents were asked to indicate the growth status of their practice. Sixty-seven percent of respondents indicated their practice was growing. This is the highest percentage since the 2004 SAC survey.
Associates and Partners
Respondents were asked if they ‘would consider taking on an associate or partner within the next 12 months?’ 43% responded ‘yes’ which is consistent with previous surveys.

</table>

Components of Chiropractic Practice
Respondents were asked to estimate what percentage of their time each week was spent on various aspects of chiropractic practice including: patient care and education, documentation of care and business management during a typical week. The response options were changed in 2019 to include external marketing and/or public education. There was a small drop in the 2019 survey time estimates for each category across the board compared to the 2016 survey. This is most likely due to the inclusion of an additional response category.

*Response options were changed in 2019

Patient Visit Time Allocation
Respondents were asked to indicate how long they allowed for an average new patient visit, report of findings, progress exam and adjustment visit. The average visit time for a new patient visit was 41 minutes; the average report of findings was allocated 23 minutes; the average adjustment 13 minutes; and the average progress exam 21 minutes. These visit durations were all consistent with the 2016 SAC survey.

**Computer Equipment**

Respondents were asked whether they use a computer programme to manage their appointment book or to enter clinical information (instead of a patient file card). For the first time in 2019 respondents were also asked whether they have an online booking system. The percentage of respondents who use a computer programme to manage their appointment book grew to 90%. The percentage of respondents that use a computer programme to enter clinical information continues to grow and is 63% in the 2019 SAC survey. Forty-six percent of respondents indicated they use an online booking system in the 2019 survey.
The following tables summarise the programmes used to manage appointment books and to enter clinical information. Due to the high number of programmes available only programmes with greater than 2% of market share have been included. Cliniko now has the largest market share (45%) of the appointment book programmes in 2019.

Respondents who currently use paper-based systems in their office were asked whether they planned to acquire software that will enable them to adopt a paperless record keeping system. Of those that do not currently use a paperless system, 42% replied that they had no plans to adopt a paperless system, 48% plan to adopt a paperless system in the next five years, and 10% plan to adopt a paperless system in the future but not within the next five years. Slightly more respondents indicated that they plan to move to a paperless office in the future in the 2019 survey compared to the previous surveys.

Number of Office Visits
Respondents were asked to indicate the average number of patient visits they personally see each week. Across New Zealand based respondents, the average number of patient visits was 89 per week; the median number was 80 per week, with a maximum of 300 visits per week. These values are consistent with the 2016 SAC survey. When responses were broken down based on time in practice the steady increase in average and median practice volume seen in 2016 was less obvious.

Yearly Income

Respondents were asked to indicate their total income for 2018. Answers were recorded in income brackets of $20,000 or $50,000. Calculations of average income would be rough estimates, so median income brackets have been reported instead of averages. The figures below are for New Zealand APC holders. Two of the categories below appear down in the 2019 survey compared to the 2016 survey. This may not reflect a significant drop in income, as it may simply relate to small differences where the median value is either at the top of one income bracket or the bottom of the next in the different surveys.

2019 SAC Survey: Total income in 2018 of NZ APC holders

Q7 What was your total income last year?
Assessment / Analytical / Diagnostic EQUIPMENT

Respondents were asked to indicate which assessment/analytical/diagnostic equipment they use in their practice ‘at least sometimes’. To reduce the survey time and potential confusion when answering this question, this question was asked differently in the 2019 survey compared to previous surveys. In the 2019 survey, a simple ‘yes’ or ‘no’ answer was requested instead of an estimate of how often equipment was used. Differences in responses between the 2019 survey and previous surveys may be related to how the question was asked. From the list of equipment, the only items that are used ‘at least sometimes’ by half or more of the respondents were blood pressure cuff, a reflex hammer, and x-ray equipment.

Adjustive Procedures

Respondents were asked to indicate which adjustive procedures they use in their practice ‘at least sometimes’. This question was asked differently in previous surveys with more answer options possible. Differences in responses between the 2019 survey and previous surveys may be related to how the question was asked.

Techniques that were used by half or more of all chiropractors ‘at least sometimes’ include Diversified Technique, extremity adjusting, Activator adjusting instrument, Gonstead Technique, Thompson Technique, Sacro Occipital Technique, and cranial techniques.

*Question modified in 2019
In the 2019 SAC survey, respondents were asked to indicate what approach they use when adjusting patients to investigate how name techniques are utilised. Almost three-quarters of New Zealand chiropractors use an integrative approach best suited to each patient that draws from different name techniques.

Please indicate which statement best represents the approach you use when adjusting patients in your practice.  

<table>

Research
Respondents were asked how they use research in practice. Ninety-one percent of respondents indicated they use research in their practice. This was consistent with the 2016 survey when the question was first asked.

<table>
<thead>
<tr>
<th>Question</th>
<th>2016 SAC ‘Yes’</th>

<td>88%</td>
<td>91%</td>
</tr>
</tbody>
</table>

For the first time in 2019, respondents were asked to indicate what research they think will best serve the chiropractic profession. They were asked to rank five different categories of research from most important (1) to least important (5). Rank scores were then calculated to understand how important respondents felt the different types of research would best serve the profession. The higher the rank score the more important the category was deemed to be. Research that
investigates the effects of chiropractic care on nervous system function or health and wellness was deemed to be the most important research to serve the profession.

<table>

**The New Zealand College of Chiropractic**

This section of the survey asked respondents for their opinions regarding the College and graduates from the College. It also asked College graduates to comment on their perception of their education at the College.

To obtain a ‘net promoter score’ (NPS) relating to the College, respondents were asked to use a scale of 0 to 10 to indicate how likely is it that they would recommend the New Zealand
College of Chiropractic to a prospective student (0=Not at all likely and 10=Extremely likely). This question was first asked in 2016. Fifty-nine percent of respondents in the 2019 survey indicated that they were extremely likely (10/10) to recommend the College to a prospective student, which is an increase from 50% in the 2016 survey. The NPS was calculated by subtracting the percentage of detractors (scores of 0-6) from promoters (scores of 9-10). The 2019 SAC survey College net promoter score was 48, which is an increase from the 2016 SAC survey NPS of 38. Net promoter scores of above 0 are deemed good, and those that are 50 or above are generally considered to be excellent.

The College attempts to engage with stakeholders, so a question was introduced in the 2016 survey that asked if respondents engage with the College. In 2019 44% of respondents indicated they do engage with the College, which is a decrease from 55% of respondents in 2016.

<table>
<thead>

<td>32%</td>
</tr>
</tbody>
</table>

**Graduate Profile**

The next questions informed respondents that the College had developed a graduate profile that describes the characteristics and attributes they believe will help graduates to develop into the ‘world’s best chiropractors.’ Respondents were asked to indicate whether they felt they were in a position to provide feedback about recent College graduates (graduates from the last three years). Twenty-six percent of respondents were a recent graduate, and 32% were familiar with recent NZCC graduates so provided feedback related to the College’s graduate profile.

<table>
<thead>
<tr>
<th>Are you in a position to provide feedback about recent College graduates</th>
<th>2019 SAC Survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes, I am a recent NZCC graduate</td>
<td>26%</td>

<tr>
<td>Yes, I am familiar with recent NZCC graduates</td>
<td>32%</td>
</tr>
<tr>
<td>No, I am not familiar with any recent NZCC graduates</td>
<td>42%</td>
</tr>
</tbody>
</table>
Recent graduates were asked to self-reflect about whether they agree or disagree with statements from the College’s graduate profile. Recent graduates indicated that they felt they exemplify all graduate profile statements well and agreed most strongly with the statements relating to their professionalism, commitment to further development, and willingness to collaborate.

<table>
<thead>

</tr>
</tbody>
</table>

Respondents who were familiar with recent graduates were asked to indicate whether they agree or disagree that the following graduate profile statements exemplify the characteristics and attributes of the recent NZCC graduates that they know. As with most exercises that involve either self-reflection or judging others, the recent graduates who were self-reflecting gave themselves higher rankings in relation to the graduate profile statements compared to respondents who weren’t recent graduates. Respondents judging recent graduates gave similar responses to all graduate profile statements with the statement relating to eloquent communication ranking the highest.

</tbody>
</table>

College graduates were asked to indicate in what areas they felt the College prepared them well for practice. Consistent themes to emerge were that College graduates felt the technique programme prepared them well for practice and the communication skills they learnt and their understanding of philosophy prepared them well for practice. These were consistent with the responses from the 2016 SAC survey.

College graduates were also asked to indicate how the College could have better prepared them for practice. The most consistent theme for this question in the 2019 survey was that graduates would have liked to have been better prepared for many aspects of running and growing a business. This was also the most consistent theme in the 2016 SAC survey. In the 2019 survey, some graduates also indicated that they would have liked to focus more on communication strategies.

The last question in the 2019 SAC survey asked College graduates whether their perception of the College had improved, stayed the same, or declined since graduating. In the 2019 SAC survey, 27% of graduates indicated their perception had improved, which was a decrease from 37% in the 2016 survey. Thirteen percent of respondents indicated their perception of the College had declined since graduating in the 2019 SAC survey, which is similar to the 10% of

35 •
respondents in the 2016 survey. These results aren’t necessarily negative, as it may indicate that recent graduates in the 2019 survey were more impressed with the College at the time of their graduation and felt that the College has remained consistent since graduation.
